## NITHI MOUNTAIN DRILLING UPDATE

Drilling operations commenced on May 11 to test both the Gamma and Gamma West zones located on the Nithi Mountain moly property in central British Columbia. Two diamond drill rigs are operating at Nithi, one on each zone. These holes are normally drilled to a depth of approximately 250 metres and require about a day and a half. Thus far, sixteen holes have been completed, eight on both zones. A stringent quality-control protocol (QA/QC) is followed on this drilling program. Core samples are oriented where possible and logged for RQD data.

The objective of the drilling at Gamma is to infill between previous drillholes at 50m spacing to have sufficient drill density in order to calculate an initial indicated resource for the zone. In addition, holes have been planned to test the full dimensions of this moly system.

The Gamma zone is separated from the Gamma West by faulting. The initial drilling of the margins of this zone was completed in January and confirmed the presence of moly mineralization at Gamma West. The current program is designed to outline the extent of this zone as a guide to more detailed drilling such as is being completed at Gamma.

Two shipments of split core have been sent for analysis. When received at the lab, it will require about seven business days for the analyses to be completed. When these lab results have been compiled, they will be released.
